referred to=
in this white paper is a crypto-asset other than EMTs and ARTs and is
depl=
oyed natively on the VerifiedX network, according to the DTI FFG shown
in s=
ection F.14, as of 2026-04-21. The maximum supply of the crypto-asset
is 20=
0,000,000 VFX tokens. The first activity of the VerifiedX network can
be vi=
ewed on 2022-07-17 (source: <https://spyglass.verifiedx.io/block/1>).</
p>
<p>VerifiedX is an open-source, decentralised Layer 1 blockchain
designed t=
o operate as a Bitcoin reliever chain, extending Bitcoin=E2=80=93s
utility =
through self-custodial, non-synthetic programmability. The network is
inten=
ded to support the tokenisation, transfer, storage and exchange of
digital =
and physical assets through on-chain functionality. It uses a
consensus mec=
hanism referred to as Proof of Assurance, under which validators are

required to maintain an assured VFX balance in order to participate in block production. The network also includes a native smart contract framework based on self-executing smart contracts written in Trillium, under which contract instructions are processed directly by participating nodes rather than through a separate virtual machine. In addition, the network includes a mechanism for tokenised Bitcoin representation through vBTC and a beacon-based system for peer-to-peer transfer of media files, with locator data stored on-chain.

The crypto-asset VFX is used as the native crypto-asset of the VerifiedX network. It is used to pay transaction fees and network service fees, and those fees are burned when processed on-chain. VFX is required to participate as a validator through the assurance mechanism and may be used in connection with governance processes within the network. The crypto-asset is also used for minting supported token formats, including VFX10 NFTs and VFX20 fungible tokens, and for settlement of peer-to-peer transactions and other network activities. The network also supports vBTC as a tokenised representation of Bitcoin on a 1:1 basis, with minting and burning processes linked to verification of Bitcoin deposits and withdrawals by designated validators.

The crypto-asset does not grant any legally enforceable or contractual rights or obligations to its holders or purchasers. Any functionalities accessible through the underlying technology are purely technical or operational in nature and do not confer rights comparable to ownership, profit participation, governance, or similar entitlements known from traditional financial instruments.

09. Information about the quality and quantity

of goods or services to which the utility tokens give access and restrictions on the transferability

ips, and related administrative matters. The legal entity does not conduct any other business activity.

A.14 Parent company business activity
VerifiedX LLC does not have a parent company. Accordingly, no business activity of a parent company is to be reported in this section.

A.15 Newly established
VerifiedX LLC has been established since 2023-10-17 and is therefore newly established (i.e. less than three years).

A.16 Financial condition for the past three years
Not applicable. The company has been established for less than three years and its financial condition is provided in Part A.17 below.

A.17 Financial condition since registration
VerifiedX is a newly established legal entity with limited financial history and limited financial resources. Since its registration, the company has not generated material revenue and has not carried out for-profit commercial activities, received offerings, or other revenue-generating operations. It has not conducted or received financing rounds, external funding, public grants, or comparable third-party financing to date. No audited or unaudited financial statements covering a full financial year are available as of the date of

Part D Information about the crypto-asset project

D.1 Crypto-asset project name

Long Name: "VerifiedX", Short Name: "VFX" according to the Digital Token Identifier Foundation (www.dtif.org, DTI see F.13, FFG DTI see F.14 as of 2026-04-21).

D.2 Crypto-assets name

Long Name: "VerifiedX" according to the Digital Token Identifier Foundation (www.dtif.org, DTI see F.13, FFG DTI see F.14 as of 2026-04-21).

D.3 Abbreviation

contextRef=
=3D"ctx_period_20260507_20260521" escape=3D"false" xml:lang=3D"en"
id=3D"D.
3_xbrl_fact">Short Name: "VFX" according to the Digital Token
Identifier Fo=
undation (www.dtif.org, DTI see F.13, FFG DTI see F.14 as of
2026-04-21).</=
ix:nonNumeric></div>

<h3 id=3D"D.4">D.4 Crypto-asset project description</h3>
<div><ix:nonNumeric
name=3D"mica:DescriptionOfOtherTokenProjectExplanatory"=
contextRef=3D"ctx_period_20260507_20260521" escape=3D"true"
xml:lang=3D"en"
" id=3D"D.4_xbrl_fact"><p>VerifiedX (VFX) is an open-source,
decentralised =
Layer 1 blockchain designed to support tokenised self-custody, on-
chain sto=
rage, peer-to-peer commerce, and Bitcoin-related functionality within
a bro=
ader distributed-ledger environment. VerifiedX operates as a Bitcoin
reliev=
er chain, providing infrastructure for the exchange and transfer of
digital=
and physical assets, as well as for the deployment of smart-contract
based=
applications and related on-chain services.</p>
<p>The VerifiedX network operates through a set of integrated
technical com=
ponents. These include vBTC, a Bitcoin-linked token representation
that ena=
bles Bitcoin-related use cases within the network environment,
including in=
teraction with smart contracts. The project also includes Vault
Accounts de=
signed to support transaction recovery and asset-protection features,
a Tri=
llium smart-contract framework for self-executing smart contract
logic, and=
a Beacon system intended to facilitate the transfer of larger media
files =
without storing the full underlying content directly on-chain. More
broadly=
, the network uses a custom validator model, on-chain governance
processes,=
and a fixed-supply, deflationary fee design under which transaction
and se=
rvice fees are burned rather than redistributed through block
rewards.</p>
<p>The project does not involve the granting of ownership, profit-

participa=
tion rights, or legal claims against the project entity or its
contributors=
. Instead, it centres on the creation of a technical environment in
which t=
he VFX crypto-asset may serve as a governance and functional input for
cert=
ain protocol processes. The long-term evolution of the VerifiedX
system, in=
cluding the scope of available features, the decentralisation roadmap,
vali=
dator-selection mechanisms, and the operational continuity of the
infrastru=
cture, may vary based on technical, economic, and regulatory
considerations=
. All future developments remain subject to change.</p></

```

E.35 The token is intended to be listed on the trading platform operated by Payward Global Solutions LTD ("Kraken"). Access to this platform depends on regional availability and user eligibility under Kraken's terms and conditions. Investors should consult Kraken's official documentation to determine whether they meet the requirements for account creation and token trading.

E.36 Involved costs

The costs involved in accessing the trading platform depend on the specific fee structure and terms of the respective cryptocurrency asset service provider. These may include trading fees, deposit or withdrawal charges, and network-related gas fees. Investors are advised to consult the applicable fee schedule of the chosen platform before engaging in trading activities.

E.37 Offer expenses

Not applicable, as this white paper is written to seek admission to trading, not for the initial offer to the public.

E.38 Conflicts of interest

MiCA-compliant cryptocurrency asset service providers shall have strong measures in place in order to manage

nage conflicts of interest. Due to the broad audience this white paper
addr=
esses, potential investors should always check the conflicts-of-
interest po=
licy of their respective counterparty.</p></ix:nonNumeric></div>

<h2 id=3D"part_F">Part F =E2=80=93 Information about the crypto-
assets</h2>
<2>

<h3 id=3D"F.1">F.1 Crypto-asset type</h3>
<div><ix:nonNumeric name=3D"mica:OtherTokenType"
contextRef=3D"ctx_period_2=
0260507_20260521" escape=3D"false" xml:lang=3D"en"
id=3D"F.1_xbrl_fact">The=
crypto-asset described in the white paper is classified as a crypto-
asset =
under the Markets in Crypto-Assets Regulation (MiCA) but is neither
classif=
ied as an electronic money token (EMT) nor an asset-referenced token
(ART).=
It is a digital representation of value that can be stored and
transferred=
using distributed ledger technology (DLT) or similar technology,
without e=
mbodying or conferring any rights to its holder. The crypto-asset does
not =

aim to maintain a stable value by referencing an official currency, a basket of assets, or any other underlying rights. Instead, its valuation is entirely market-driven, based on supply and demand dynamics, and it is not subject to any stabilisation mechanism. It is neither pegged to any fiat currency nor backed by any external assets, which distinguishes it from EMTs and ARTs. Furthermore, the crypto-asset is not categorised as a financial instrument, deposit, insurance product, pension product, or any other regulated financial product under EU law. It does not grant financial rights, voting rights, or any contractual claims to its holders, and therefore remains outside the scope of regulatory frameworks applicable to traditional financial instruments.

F.2 Crypto-asset functionality

VerifiedX (VFX) is the native crypto-asset of the VerifiedX blockchain and functions as the principal on-chain technical component within the VerifiedX protocol environment. VFX is used in the network for the payment of transaction fees and service fees, including fees associated with transfers, network services, Vault accounts, DNS-related functions, and peer-to-peer auction activity. VFX is also used in connection with the minting of tokenised assets on the network, including VFX10 and VFX20 token standards, and supports additional on-chain activities such as transfers, peer-to-peer exchange, lending, swaps, and other interactions made available within the VerifiedX ecosystem.

VFX is further integrated into the operation of the VerifiedX blockchain through its Proof of Assurance consensus model. Participants seeking to join

in the validator pool are required to assure a specified balance of VFX in order to participate in block creation and validator activity. VFX also functions as a governance-related input within the network, as validator participation is linked to voting on network proposals, protocol changes, upgrades, and other enhancements within the VerifiedX environment. In addition, VFX is used in connection with specialised blockchain features such as State Accounts, Vault Accounts, and the minting and use of Bitcoin-linked, self-custodial, non-synthetic representations such as vBTC within the VerifiedX ecosystem.

The VFX crypto-asset does not confer ownership, profit participation, governance rights over the issuer or any related entity, or any form of economic entitlement. All functionalities are technical in nature and relate exclusively to interactions within the VerifiedX protocol environment. The usability of VFX depends on factors such as the continued operation of the relevant protocol infrastructure, the performance and security of the VerifiedX blockchain, the correct functioning of consensus and smart-contract related systems, and future development decisions associated with the VerifiedX project.

F.3 Planned application of functionalities

mica:InformationAboutPlannedApplicationOfFunctionalitiesExplanatory contextRef=3D"ctx_period_20260507_20260521" escape=3D="true" xml:lang=3D"en" id=3D"F.3_xbrl_fact"><p>Future milestones:</p><p>- Oracle Data / Validator Upgrade (Q1 2026, ongoing): An upgrade relating to oracle data and validator infrastructure is planned.</p><p>- P2P Smart Contract Release (Q1 2026, ongoing): Peer-to-peer smart contracts with automated execution based on minter parameters and inputs for decentralised and self-custodial borrowing and lending are planned for release</p></div>

e.

sset does not confer any legally enforceable rights or obligations,
there a=
re no conditions or mechanisms for modifying such rights or

obligations. Amendments to the technical protocol, smart contract logic, or related systems may occur in the ordinary course of development or maintenance. Such changes do not alter the legal position of holders, as no contractual rights exist and no rights arise under applicable law or regulation. Holders should not interpret technical updates or governance-related changes as amendments to legally binding entitlements.

G.4 Future public offers

No future public offers of crypto-assets are currently planned by the issuer at the time of writing this white paper.

G.5 Issuer retained crypto-assets

The current amount retained by VerifiedX LLC is approximately 32.3 million VFX, which are reserved for partnerships, bug bounties, integrations, and liquidity purposes.

G.6 Utility token classification

No crypto-asset project does not concern utility tokens as defined in Article 3(9) of Regulation (EU) 2023/1114.

G.7 Key features of goods/services of utility tokens

Not applicable, as the crypto-asset described herein is not a utility token.

G.8 Utility tokens redemption

Not applicable, as the crypto-asset described herein is not a utility token.

G.9 Non-trading request

The admission to trading =
is sought.

G.10 Crypto-assets purchase or sale modalities

Not applicable, as this =
white paper is written to seek admission to trading, not for the initial offer to the public.

G.11 Crypto-assets transfer restrictions

ix:nonNumeric
name="mica:OtherTokensTransferRestrictionsExplanatory"
contextRef="ctx_period_20260507_20260521" escape="true"
xml:lang="en" id="G.11_xbrl_fact">

The crypto-assets themselves are not subject to =
any technical or contractual transfer restrictions and are generally freely transferable. However, crypto-asset service providers may impose restrictions on buyers or sellers in accordance with applicable laws, internal policies or contractual terms agreed with their clients.

G.12 Supply adjustment protocols

No – there are no fixed =
protocols that increase the supply of the crypto-asset in response to changes in demand as of 2026-04-21.

However, the protocol includes a built-in fee-burning mechanism under which all transaction fees and network service fees are permanently burned at =
the time of processing, reducing the circulating supply over time. In addition, it is possible to decrease the circulating supply by transferring crypto-assets to so-called burn addresses. These are addresses from which the tokens are no longer intended to be transferred or accessed, effectively removing them from circulation.

ml:lang=3D"en" id=3D"H.2_xbrl_fact"><p>The crypto-asset in scope is
impleme=
nted on the VerifiedX network following the standards described
below.</p>
<p>The following applies to VerifiedX:</p>
<p>The crypto-asset operates on a defined set of protocols and
technical st=
andards intended to support the operation, security, and functionality
of t=
he VerifiedX blockchain network. Below are some of the key ones:</p>
<p>1. Network protocols</p>
<p>- The crypto-asset operates on a decentralised Layer 1 blockchain
networ=
k with peer-to-peer communication between nodes.</p>
<p>- Peer communication and message propagation are handled through a
P2P l=
ayer using SignalR and websockets to maintain open connections between
node=
s.</p>

Nodes query peers for the latest block and broadcast newly generated blocks to the network to remain synchronised.

2. Consensus and validation standards

The crypto-asset uses a custom consensus mechanism referred to as Proof-of-Assurance (PoA).

Validators are required to maintain 5,000 VFX in their wallet to participate in block crafting and governance.

Block production is assigned through rotating randomised casters. Casters generate cryptographic proofs using SHA256-based hashing, and the network deterministically selects a winner from the available proofs.

Other validators then lock the selected winner and vote to confirm block production. If the selected caster fails to produce the block, backup winners may be selected from the available proofs.

3. Cryptographic and data integrity standards

The crypto-asset uses SHA-256, frequently in double SHA-256 form, for transaction hashes, Merkle roots, and validator proofs.

ECDSA is used for private keys, transaction signing, and verification of block origin.

Transactions within a block are organised into Merkle trees formed from double SHA-256 hashes for integrity verification.

Addresses are encoded using Base58.

Timestamps follow the UNIX epoch standard.

4. Wallet and address standards

The network follows BIP-32 and BIP-39 standards for hierarchical deterministic wallets and mnemonic recovery phrases.

5. Protocol improvement standards

The network uses an on-chain voting process for protocol changes and network improvements.

Validators participate in voting on proposals, enhancements, and changes to network parameters.

Significant protocol changes require an 80% approval vote from the validator pool before implementation.

H.3 Technology used

mica:InformationAboutTechnologyUsedForOtherTokens

nExplanatory" contextRef=3D"ctx_period_20260507_20260521" escape=3D"true" x=ml:lang=3D"en" id=3D"H.3_xbrl_fact"><p>The crypto-asset in scope is implemented on the VerifiedX network following the standards described below.</p><p>The following applies to VerifiedX:</p><p>1. Decentralised ledger: The VerifiedX blockchain operates as a decentralised account-based ledger that records transfers, balances, and related state changes in a manner intended to preserve an ordered and verifiable record of transactions.</p><p>2. Private key management: To safeguard their VFX holdings, users must securely store their wallet private keys and recovery phrases.</p><p>3. Cryptographic integrity: The network uses ECDSA for key generation and transaction signing, and SHA-256, including double SHA-256 in certain cases, for hashing functions such as transaction identification and Merkle-tree construction.</p></ix:nonNumeric></div>

<h3 id=3D"H.4">H.4 Consensus mechanism</h3><div><ix:nonNumeric name=3D"mica:ConsensusMechanismForOtherTokenExplanatory" contextRef=3D"ctx_period_20260507_20260521" escape=3D"true" xml:lang=3D"en" id=3D"H.4_xbrl_fact"><p>The crypto-asset in scope is implemented on the VerifiedX network following the standards described below.</p><p>The following applies to VerifiedX:</p><p>The crypto-asset's consensus mechanism is Proof of Assurance (PoA), which is intended to support network security and decentralisation through validator participation based on wallet-held VFX balances. To participate in validation, a validator must maintain 5,000 VFX in its wallet. Block production is assigned through rotating randomised casters. Participating casters generate cryptographic proofs using SHA256-based hashing and broadcast them to the network. Other validators then deterministically lock a winner based on the outcome of those proofs and vote to confirm that caster as =

the block producer. The selected caster is then expected to submit the queue=ed block to the chain. If the selected caster fails to do so, backup winner= s may be selected from the available proofs.</p><p>The network maintains a target block time of approximately 12 seconds. Once a block is confirmed by the validator pool and added to the chain, the model is described as deterministic under normal operating conditions. The network also includes a fallback approach for hostile scenarios in which honest validators reject an invalid chain and continue operating separately. The protocol distinguishes between ordinary validator inactivity and malicious conduct. Where a validator is determined by peer vote to have acted maliciously, the assured coins may be permanently locked and sacrificed by the network.</p></ix:nonNumeric></div>

<h3 id=3D"H.5">H.5 Incentive mechanisms and applicable fees</h3><div><ix:nonNumeric name=3D"mica:IncentiveMechanismsAndApplicableFeesFor0th=erTokenExplanatory" contextRef=3D"ctx_period_20260507_20260521" escape=3D"true" xml:lang=3D"en" id=3D"H.5_xbrl_fact"><p>The crypto-asset in scope is implemented on the VerifiedX network following the standards described below.</p><p>The following applies to VerifiedX:</p><p>The crypto-asset=E2=80=99s incentive mechanism does not rely on protocol-level block rewards or inflation. Instead, the VerifiedX network operates with a fixed lifetime supply of 200,000,000 VFX and a deflationary design. Following a protocol upgrade, block rewards were reduced to zero. The current protocol does not issue new VFX as rewards for block production. Validators do not receive automated protocol-level compensation in the form of newly minted tokens or redistributed transaction fees. Rather, validator participation is linked primarily to governance rights within the network, including

ding participation in the approval of network proposals and changes.

Transaction fees apply to network use and are paid by the sender of a transaction. These fees are kept at near-zero levels by protocol design. Transaction and network service fees are not redistributed to validators, miners, or a treasury. Instead, such fees are permanently burned at the time of the transaction. Additional network service fees may also apply in connection with services such as Vault accounts, DNS, and peer-to-peer auctions, and these fees are likewise burned.

The protocol also includes a penalty mechanism for malicious validator behaviour. Where a validator is determined by the validator pool to have acted maliciously, the assured coins required for validator participation may be permanently locked and rendered unspendable.

H.6 Use of distributed ledger technology

No the DLT is not operated by the issuer, the offeror, the person seeking admission to trading, or any third party acting on their behalf.

H.7 DLT functionality description

Not applicable, as the DLT is not operated by the issuer, the offeror, the person seeking admission to trading, or any third party acting on their behalf.

H.8 Audit

An audit of the technology used was conducted.

<h2 id=3D"part_I">Part I =E2=80=93 Information on risks</h2>

<h3 id=3D"I.1">I.1 Offer-related risks</h3>

<div><ix:nonNumeric
name=3D"mica:DescriptionOfOfferrelatedRisksForOtherTokenExplanatory" contextRef=3D"ctx_period_20260507_20260521"
escape=3D"true" x=
ml:lang=3D"en" id=3D"I.1_xbrl_fact"><p>1. Regulatory and Compliance</p>
<p>Regulatory frameworks applicable to crypto-asset services in the
Europea=
n Union and in third countries are evolving. Supervisory authorities
may in=
troduce, interpret, or enforce rules that affect (i) the eligibility
of thi=
s crypto-asset for admission to trading, (ii) the conditions under
which a =
crypto-asset service provider may offer trading, custody, or transfer
servi=
ces for it, or (iii) the persons or jurisdictions to which such
services ma=
y be provided. As a result, the crypto-asset service provider
admitting thi=
s crypto-asset to trading may be required to suspend, restrict, or
terminat=
e trading or withdrawals for regulatory reasons, even if the crypto-
asset i=
tself continues to function on its underlying network.</p>

<p>2. Trading venue and connection risk</p>

<p>Trading in the crypto-asset depends on the uninterrupted operation of the trading venues on which it is listed and, where applicable, on its technical connections to external liquidity sources or venues. Interruptions such as system downtime, maintenance, faulty integrations, API changes, or failures at an external venue can temporarily prevent order placement, execution, deposits, or withdrawals, even when the underlying blockchain is functioning. In addition, trading platforms in emerging markets may operate under differing governance, compliance, and oversight standards, which can increase the risk of operational failures or disorderly market conditions.</p>

<p>3. Market formation and liquidity conditions</p>

<p>The price and tradability of the crypto-asset depend on actual trading activity on the venues to which the service provider is connected, whether centralised exchanges (CEXs) or decentralised exchanges (DEXs). Trading volumes may at times be low, order books thin, or liquidity concentrated on a single venue. In such conditions, buy or sell orders may not be executed in full or may be executed only at a less favourable price, resulting in slippage.</p>

<p>Volatility: The market price of the crypto-asset may fluctuate significantly over short periods, including for reasons that are not linked to changes in the underlying project or protocol. Periods of limited liquidity, shifts in overall market sentiment, or trading on only a small number of CEXs or DEXs can amplify these movements and lead to higher slippage when orders are executed. As a result, investors may be unable to sell the crypto-asset at or close to a previously observed price, even where no negative project-specific event has occurred.</p>

<p>4. Counterparty and service provider dependence</p>

<p>The admission of the crypto-asset to trading may rely on several

external parties, such as connected centralised or decentralised trading venues, liquidity providers, brokers, custodians, or technical integrators. If any of these counterparties fail to perform, suspend their services, or apply internal restrictions, the trading, deposit, or withdrawal of the crypto-asset on the listing crypto-asset service provider can be interrupted or halted.

Quality of counterparties: Trading venues and service providers in certain jurisdictions may operate under regulatory or supervisory standards that are lower or differently enforced than those applicable in the European Union. In such environments, deficiencies in governance, risk management, or compliance may remain undetected, which increases the probability of abrupt service interruptions, investigations, or forced wind-downs.

Delisting and service suspension: The crypto-asset's availability may depend on the internal listing decisions of these counterparties. A delisting or suspension on a key connected venue can materially reduce liquidity or make trading temporarily impossible on the admitting service provider, even if the underlying crypto-asset continues to function.

Insolvency of counterparties: If a counterparty involved in holding, routing, or settling the crypto-asset becomes insolvent, enters restructuring, or is otherwise subject to resolution measures, assets held or processed by that counterparty may be frozen, become temporarily unavailable, or be recoverable only in part or not at all, which can result in losses for clients whose positions were maintained through that counterparty. This risk applies in particular where client assets are held on an omnibus basis or where segregation is not fully recognised in the counterparty's jurisdiction.

5. Operational and information risks

Due to the irrevocability of blockchain transactions, incorrect transaction approvals or the use of wrong networks or addresses will typically make the transferred funds irrecoverable. Because trading may also rely on technical connections to other venues or service providers, downtime or faulty code in these connections can temporarily block trading, deposits, or withdrawals even when the underlying blockchain is functioning. In addition, different groups of market participants may have unequal access to technical, governance, or project-related information, which can lead to information asymmetry and place less informed investors at a disadvantage when making trading decisions.

6. Market access and liquidity concentration risk

If the crypto-asset is only available on a limited number of trading platforms or through a single market-making entity, this may result in reduced liquidity, greater price volatility, or periods of inaccessibility for retail holders.

I.2 Issuer-related risks

1. Insolvency of the issuer

As with any commercial entity, the issuer may face insolvency risks. These may result from insufficient funding, low market interest, mismanagement, or external shocks (e.g. pandemics, armed conflicts). In such a case, ongoing development, support, and governance of the project may cease, potentially affecting the viability and tradability of the crypto-asset.

2. Legal and regulatory risks

The issuer operates in a dynamic and evolving regulatory environment. Failure to comply with applicable laws or regulations in relevant jurisdictions may result in enforcement actions, penalties, or restrictions on

the project=E2=80=99s operations. These may negatively impact the crypto-asset=E2=80=99s availability, market acceptance, or legal status.

3. Operational risks

The issuer may fail to implement adequate internal controls, risk management, or governance processes. This can result in operational disruptions, financial losses, delays in updating the white paper, or reputational damage.

4. Governance and decision-making

The issuer=E2=80=99s management body is responsible for key strategic, operational, and disclosure decisions. Ineffective governance, delays in decision-making, or lack of resources may compromise the stability of the project and its compliance with MiCA requirements. High concentration of decision-making authority or changes in ownership/control can amplify these risks.

5. Reputational risks

The issuer=E2=80=99s reputation may be harmed by internal failures, external accusations, or association with illicit activity. Negative publicity can reduce trust in the issuer and impact the perceived legitimacy or value of the crypto-asset.

6. Counterparty dependence

The issuer may depend on third-party providers for certain core functions, such as technology development, marketing, legal advice, or infrastructure. If these partners discontinue their services, change ownership, or underperform, the issuer=E2=80=99s ability to operate the project or maintain investor communication may be impaired. This could disrupt project continuity or undermine market confidence, ultimately affecting the crypto-asset=E2=80=99s value.

I.3 Crypto-assets-related risks

tRef=3D"ctx_period_20260507_20260521" escape=3D"true" xml:lang=3D"en" id=3D="I.3_xbrl_fact"><p>1. Valuation risk</p><p>The crypto-asset does not represent a claim, nor is it backed by physical assets or legal entitlements. Its market value is driven solely by supply and demand dynamics and may fluctuate significantly. In the absence of fundamental value anchors, such assets can lose their entire market value within a very short time. Historical market behaviour has shown that some types of crypto-assets have become worthless. Investors should be aware that this crypto-asset may lose all of its value.</p><p>2. Market volatility risk</p><p>Crypto-asset prices can fluctuate sharply due to changes in market sentiment, macroeconomic conditions, regulatory developments, or technology trends. Such volatility may result in rapid and significant losses. Holders should be prepared for the possibility of losing the full amount invested.</p><p>3. Liquidity and price-determination risk</p><p>Low trading volumes, fragmented trading across venues, or the absence of active market makers can restrict the ability to buy or sell the crypto-asset. In such situations, it is not guaranteed that an observable market price will exist at all times. Spreads may widen materially, and orders may only be executable under unfavourable conditions, which can make liquidation costly or temporarily impossible.</p><p>4. Crypto-asset security risk</p><p>Loss or theft of private keys, unauthorised access to wallets, or failures of custodial or exchange service providers can result in the irreversible loss of assets. Because blockchain transactions are final, recovery of funds after a compromise is generally impossible.</p><p>5. Fraud and scam risk</p><p>The pseudonymous and irreversible nature of blockchain transactions can attract fraudulent schemes. Typical forms include fake or unauthorised cryp=

to-assets imitating established ones, phishing attempts, deceptive airdrops, or social-engineering attacks. Investors should exercise caution and verify the authenticity of counterparties and information sources.

6. Legal and regulatory reclassification risk

Legislative or regulatory changes in the European Union or in the Member State where the crypto-asset is admitted to trading may alter its legal classification, permitted uses, or tradability. In third countries, the crypto-asset may be treated as a financial instrument or security, which can restrict its offering, trading, or custody.

7. Absence of investor protection

The crypto-asset is not covered by investor-compensation or deposit-guarantee schemes. In the event of loss, fraud, or insolvency of a service provider, holders may have no access to recourse mechanisms typically available in regulated financial markets.

8. Counterparty risk

Reliance on third-party exchanges, custodians, or intermediaries exposes holders to operational failures, insolvency, or fraud of these parties. Investors should conduct due diligence on service providers, as their failure may lead to the partial or total loss of held assets.

9. Reputational risk

Negative publicity related to security incidents, misuse of blockchain technology, or associations with illicit activity can damage public confidence and reduce the crypto-asset's market value.

10. Community and sentiment risk

Because the crypto-asset's perceived relevance and expected future use depend largely on community engagement and the prevailing sentiment, a loss of public interest, negative coverage or reduced activity of key contributors can materially reduce market demand.

11. Macroeconomic and interest-rate risk

Fluctuations in interest rates, exchange rates, general market conditions, or overall market volatility can influence investor sentiment towards digital assets.

gital assets and affect the crypto-asset=E2=80=99s market value.</p>
 <p>12. Taxation risk</p>
 <p>Tax treatment varies across jurisdictions. Holders are individually resp=onsible for complying with all applicable tax laws, including the reporting=and payment of taxes arising from the acquisition, holding, or disposal of=the crypto-asset.</p>
 <p>13. Anti-money-laundering and counter-terrorist financing risk</p>
 <p>Wallet addresses or transactions connected to the crypto-asset may be li=nked to sanctioned or illicit activity. Regulatory responses to such findin=gs may include transfer restrictions, reporting obligations, or the freezin=g of assets on certain venues.</p>
 <p>14. Market-abuse risk</p>
 <p>Due to limited oversight and transparency, crypto-assets may be vulnerab=le to market-abuse practices such as spoofing, pump-and-dump schemes, or in=sider trading. Such activities can distort prices and expose holders to sud=den losses.</p>
 <p>15. Legal ownership and jurisdictional risk</p>
 <p>Depending on the applicable law, holders of the crypto-asset may not hav=e enforceable ownership rights or effective legal remedies in cases of disp=utes, fraud, or service failure. In certain jurisdictions, access to exchan=ges or interfaces may be restricted by regulatory measures, even if on-chai=n transfer remains technically possible.</p>
 <p>16. Concentration risk</p>
 <p>A large proportion of the total supply may be held by a small number of =holders. This can enable market manipulation, governance dominance, or sudd=en large-scale liquidations that adversely affect market stability, price l=vels, and investor confidence.</p></ix:nonNumeric></div>

<h3 id=3D"I.4">I.4 Project implementation-related risks</h3>
 <div><ix:nonNumeric
 name=3D"mica:ProjectImplementationrelatedRisksExplanato=ry" contextRef=3D"ctx_period_20260507_20260521" escape=3D"true"
 xml:lang=3D="en" id=3D"I.4_xbrl_fact"><p>As this white paper relates to admission

to trading of the crypto-asset, the risk description below reflects general implementation risks typically associated with crypto-asset projects and relevant for the crypto-asset service provider.

Delays, failures, or changes in the implementation of the project as outlined in its public roadmap or technical documentation may negatively impact the perceived credibility or usability of the crypto-asset. This includes risks related to project governance, resource allocation, technical delivery, and team continuity.

Key-person risk: The project may rely on a limited number of individuals for development, maintenance, or strategic direction. The departure, incapacity, or misalignment of these individuals may delay or derail the implementation.

Timeline and milestone risk: Project milestones may not be met as announced. Delays in feature releases, protocol upgrades, or external integration can undermine market confidence and affect the adoption, use, or value of the crypto-asset.

Delivery risk: Even if implemented on time, certain functionalities or integrations may not perform as intended or may be scaled back during execution, limiting the crypto-asset's practical utility.

I.5 Technology-related risks

As this white paper relates to admission to trading of the crypto-asset, the following risks concern the underlying distributed ledger technology (DLT), its supporting infrastructure, and related technical dependencies. Failures or vulnerabilities in these

systems may affect the availability, integrity, or transferability of the crypto-asset.

1. Blockchain dependency risk

The functionality of the crypto-asset depends on the continuous and stable operation of the blockchain(s) on which it is issued. Network congestion, outages, or protocol errors may temporarily or permanently disrupt transactions. Extended downtime or degradation in network performance can affect trading, settlement, or the usability of the crypto-asset.

2. Smart contract vulnerability risk

The smart contract that defines the crypto-asset parameters or governs its transfers may contain coding errors or security vulnerabilities. Exploitation of such weaknesses can result in unintended token minting, permanent loss of funds, or disruption of token functionality. Even after external audits, undetected vulnerabilities may persist due to the immutable nature of deployed code.

3. Wallet and key-management risk

The custody of crypto-assets relies on secure private key management. Loss, theft, or compromise of private keys results in irreversible loss of access. Custodians, trading venues, or wallet providers may be targeted by cyberattacks. Compatibility issues between wallet software and changes to the blockchain protocol (e.g. network upgrades) can further limit user access or the ability to transfer the crypto-asset.

Outdated or vulnerable wallet software:

Users relying on outdated, unaudited, or unsupported wallet software may face compatibility issues, security vulnerabilities, or failures when interacting with the blockchain. Failure to update wallet software in line with protocol developments can result in transaction errors, loss of access, or exposure to known exploits.

4. Network security risks

Attack risks: Blockchains may be subject to denial-of-service (DoS)

attacks, 51% attacks, or other exploits targeting the consensus mechanism. These can delay transactions, compromise finality, or disrupt the accurate recording of transfers.

Centralisation concerns: Despite claims of decentralisation, a relatively small number of validators or a high concentration of stake may increase the risk of collusion, censorship, or coordinated network downtime, which can affect the resilience and operational reliability of the crypto-asset.

5. Bridge and interoperability risk

Where tokens can be bridged or wrapped across multiple blockchains, vulnerabilities in bridge protocols, validator sets, or locking mechanisms may result in loss, duplication, or misrepresentation of assets. Exploits or technical failures in these systems can instantly impact circulating supply, ownership claims, or token fungibility across chains.

6. Forking and protocol-upgrade risk

Network upgrades or disagreements among node operators or validators can result in blockchain forks, where the blockchain splits into two or more incompatible versions that continue separately from a shared past. This may lead to duplicate token representations or incompatibilities between exchanges and wallets. Until consensus stabilises, trading or transfers may be disrupted or misaligned. Such situations may be difficult for retail holders to navigate, particularly when trading platforms or wallets display inconsistent token information.

7. Economic-layer and abstraction risk

Mechanisms such as gas relayers, wrapped tokens, or synthetic representations may alter the transaction economics of the underlying token. Changes in transaction costs, token demand, or utility may reduce its usage and weaken both its economic function and perceived value within its ecosystem.

>

<p>8. Spam and network-efficiency risk</p>

<p>High volumes of low-value (=<E2=80=9Cdust=<E2=80=9D) or automated transactions may congest the network, slow validation times, inflate ledger size, a=

nd raise transaction costs. This can impair performance, reduce throughput,=

and expose address patterns to analysis, thereby reducing network efficien=

cy and privacy.</p>

<p>9. Front-end and access-interface risk</p>

<p>If users rely on centralised web interfaces or hosted wallets to interac=

t with the blockchain, service outages, malicious compromises, or domain ex=

piries affecting these interfaces may block access to the crypto-asset, eve=

n while the blockchain itself remains fully functional. Dependence on singl=

e web portals introduces a critical point of failure outside the DLT layer.=

</p>

<p>10. Decentralisation claim risk</p>

<p>While the technical infrastructure may appear distributed, the actual go=

vernance or economic control of the project may lie with a small set of act=

ors. This disconnect between marketing claims and structural reality can le=

ad to regulatory scrutiny, reputational damage, or legal uncertainty =<E2=80=

=<93 especially if the project is presented as =<E2=80=98community-governed=

=<E2=80=99 without substantiation.</p></ix:nonNumeric></div>

<h3 id=3D"I.6">I.6 Mitigation measures</h3>

<div><ix:nonNumeric

name=3D"mica:MitigationMeasuresForTechnologyRiskFor0the=

rTokenExplanatory" contextRef=3D"ctx_period_20260507_20260521"

escape=3D"tr=

ue" xml:lang=3D"en" id=3D"I.6_xbrl_fact"><p>The following measures are in p=

lace or have been adopted to mitigate the risks described in this white pap=

er:</p>

<p>- Security auditing: The VerifiedX network has been audited by Halborn, =

a tier 1 blockchain security firm, to identify and address potential vulner=

abilities in the protocol and its supporting infrastructure.

Compliance monitoring: The project has integrated with Merkle Science for blockchain tracing and compliance monitoring, covering both VFX and vBT transactions, to support the detection and prevention of illicit activity.

Open-source codebase: The VerifiedX project is fully open-source, with all source code publicly available on GitHub, enabling independent review, verification, and contribution by any party.

On-chain governance: Significant protocol changes require an 80% approval vote from the validator pool before implementation, providing a decentralised decision-making mechanism for network upgrades and parameter changes.

Malicious validator penalties: The protocol includes a penalty mechanism under which validators determined by peer vote to have acted maliciously may have their assured coins permanently locked and rendered unspendable, discouraging adversarial behaviour.

Bug bounty program: A bug bounty program has been established to support the identification of vulnerabilities and technology issues through coordinated external reporting.

y" contextRef=3D"ctx_period_20260507_20260521" escape=3D"true"
xml:lang=3D"en" id=3D"S.4_xbrl_fact"><p>The crypto-asset in scope is implemented
on the=
VerifiedX network following the standards described below.</p>
<p>The following applies to VerifiedX:</p>
<p>The crypto-asset=E2=80=99s consensus mechanism is Proof of
Assurance (Po=
A), which is intended to support network security and decentralisation
thro=
ugh validator participation based on wallet-held VFX balances. To
participa=
te in validation, a validator must maintain 5,000 VFX in its wallet.
Block =
production is assigned through rotating randomised casters.
Participating c=
asters generate cryptographic proofs using SHA256-based hashing and
broadca=
st them to the network. Other validators then deterministically lock a
winn=
er based on the outcome of those proofs and vote to confirm that
caster as =
the block producer. The selected caster is then expected to submit the
queu=
ed block to the chain. If the selected caster fails to do so, backup
winner=
s may be selected from the available proofs.</p>
<p>The network maintains a target block time of approximately 12
seconds. 0=
nce a block is confirmed by the validator pool and added to the chain,
the =
model is described as deterministic under normal operating conditions.

```

The network also includes a fallback approach for hostile scenarios in which honest validators reject an invalid chain and continue operating separately. The protocol distinguishes between ordinary validator inactivity and malicious conduct. Where a validator is determined by peer vote to have acted maliciously, the assured coins may be permanently locked and sacrificed by the network.

S.5 Incentive Mechanisms and Applicable Fees

The crypto-asset in scope is implemented on the VerifiedX network following the standards described below.

The following applies to VerifiedX:

The crypto-asset's incentive mechanism does not rely on protocol-level block rewards or inflation. Instead, the VerifiedX network operates with a fixed lifetime supply of 200,000,000 VFX and a deflationary design. Following a protocol upgrade, block rewards were reduced to zero. The current protocol does not issue new VFX as rewards for block production. Validators do not receive automated protocol-level compensation in the form of newly minted tokens or redistributed transaction fees. Rather, validator participation is linked primarily to governance rights within the network, including participation in the approval of network proposals and changes.

Transaction fees apply to network use and are paid by the sender of a transaction. These fees are kept at near-zero levels by protocol design. Transaction and network service fees are not redistributed to validators, miners, or a treasury. Instead, such fees are permanently burned at the time of

and covered the energy consumption of the hardware used within the network are the requirements for operating the relevant client software. The energy consumption of the relevant hardware devices was measured in certified test laboratories. Where available, the Functionally Fungible Group Digital Token Identifier (FFG DTI) is used to determine all technically equivalent implementations of the crypto-asset in scope, and the relevant mappings are updated regularly based on data from the Digital Token Identifier Foundation.

Information regarding the hardware used and the number of participants in the network is based on assumptions that are verified on a best-effort basis using empirical data. In general, participants are assumed to act largely economically rationally. In line with the precautionary principle, conservative assumptions are made where uncertainty exists, meaning that estimates tend towards the higher end of the reasonably plausible adverse impacts.
